

①

Plants per Meter Row

Row spacing

Plants per meter²

Plants per Slab

Plants per

$E_0 \text{ Mult} = 0.5$

PopRow

RowSp

Plant Density

PopSlab

Pop Area

$E_0 \text{ Mult} = 1.0$

— 1cm wide $\times E_0 \text{ Mult} \times \text{RowSp}$

note symmetry, Row Spacing is

(2)

distance between plants

when $E_0 \text{ Mult} = 0.5$, plant is on left side (or right) of 2D soil domain, domain width = $1/2$ row spacing

when $E_0 \text{ Mult} = 1.0$ plant is in center of 2D soil domain and domain width = row spacing

the variable PopSlab is needed to scale water, carbon, P, N, etc from the plant to soil.

all simulations consider one plant

$$\text{Plants per meter Row} = \frac{P}{M}$$

$$\text{row spacing} = M$$

$$\text{Plants per } m^2 = \frac{P}{M^2}$$

$$\text{hence } \text{PopRow} \times 1/\text{Rowsp} = \frac{P}{M^2}$$

distance between 2 plants is (m)

$$\frac{1}{\text{Poprow}}$$

thus the half row width area a plant occupies is

$$\frac{1}{\text{Poprow}} \times \text{row spacing} \times E_0 \text{ Mult} - \text{units are } m^2$$

③ Thus, if we have 6 plants per Meter row
and 0.75 m row spacing

$$\text{Plant pop} = \frac{6}{0.75} = 8 \text{ plants / m}^2$$

~~the area~~
p the half row width a plant occupies:

$$\frac{1}{6} \cdot 0.75 \times \frac{E_0 \text{ Mult}}{(0.5)} = .0625 \text{ m}^2 \text{ or } 625 \text{ cm}^2$$
